70-90% of patients with asthma, also have allergic rhinitis. People with allergic rhinitis have a higher chance of going on to develop asthma than people without allergic rhinitis.

Asthma patients with significant rhinitis are 4-5 times more likely to have poorly controlled asthma than those without rhinitis.

The presence of AR often precedes the development of asthma and is a known risk factor for asthma.

Allergic rhinitis and allergic asthma are characterized by a similar inflammatory process in which multiple inflammatory cells and mediators are involved.

Allergic rhinitis and allergic asthma are related health conditions. The presence of AR often precedes the development of asthma and is a known risk factor for asthma.
